

[544] Hadoop Ecosystem

Tyler Caraza-Harter

Learning Objectives

- describe the purpose of GFS, MapReduce, and BigTable (at a high level), and similar Hadoop systems (HDFS, Spark, and Cassandra)
- describe partitioning and replication and the motivation for each technique
- identify the role that clients, NameNodes, and DataNodes play for HDFS reads and writes

Outline: Hadoop Ecosystem

Motivation, Hadoop Ecosystem

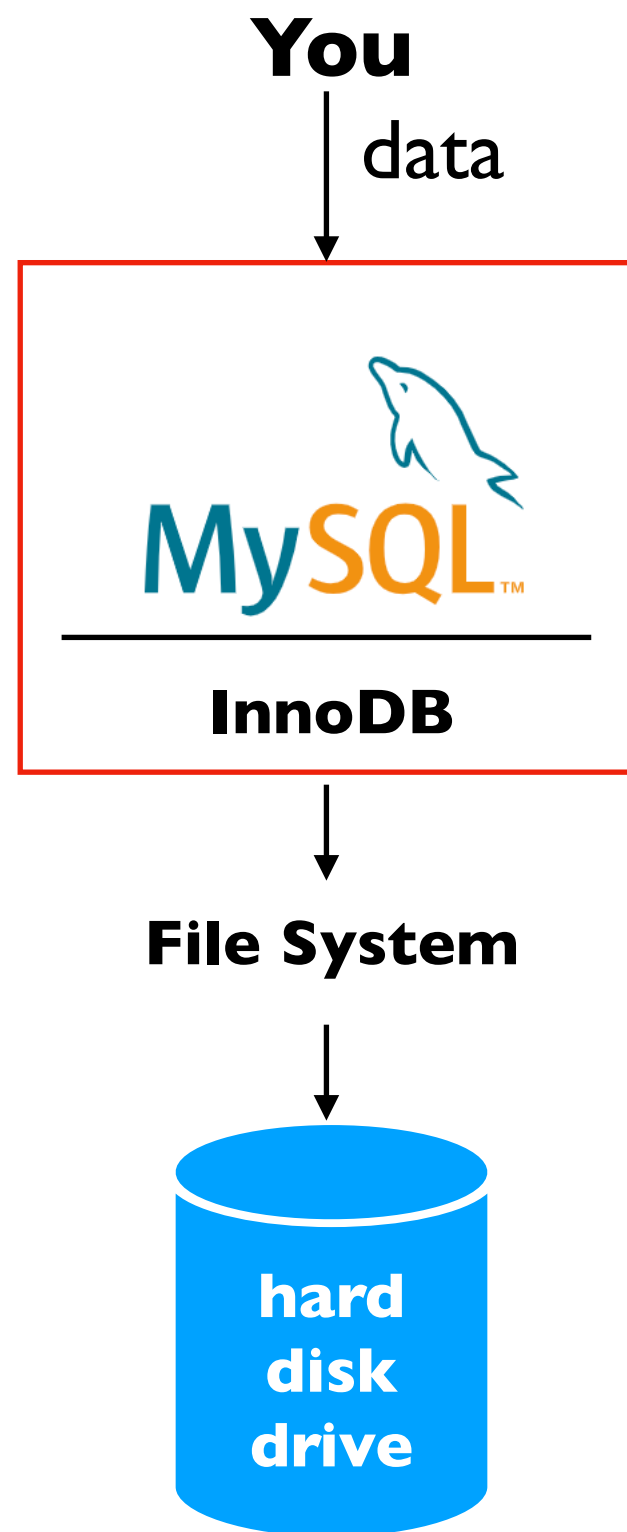

Hadoop File System (HDFS)

Design: storage systems are generally built as a composition of layered subsystems

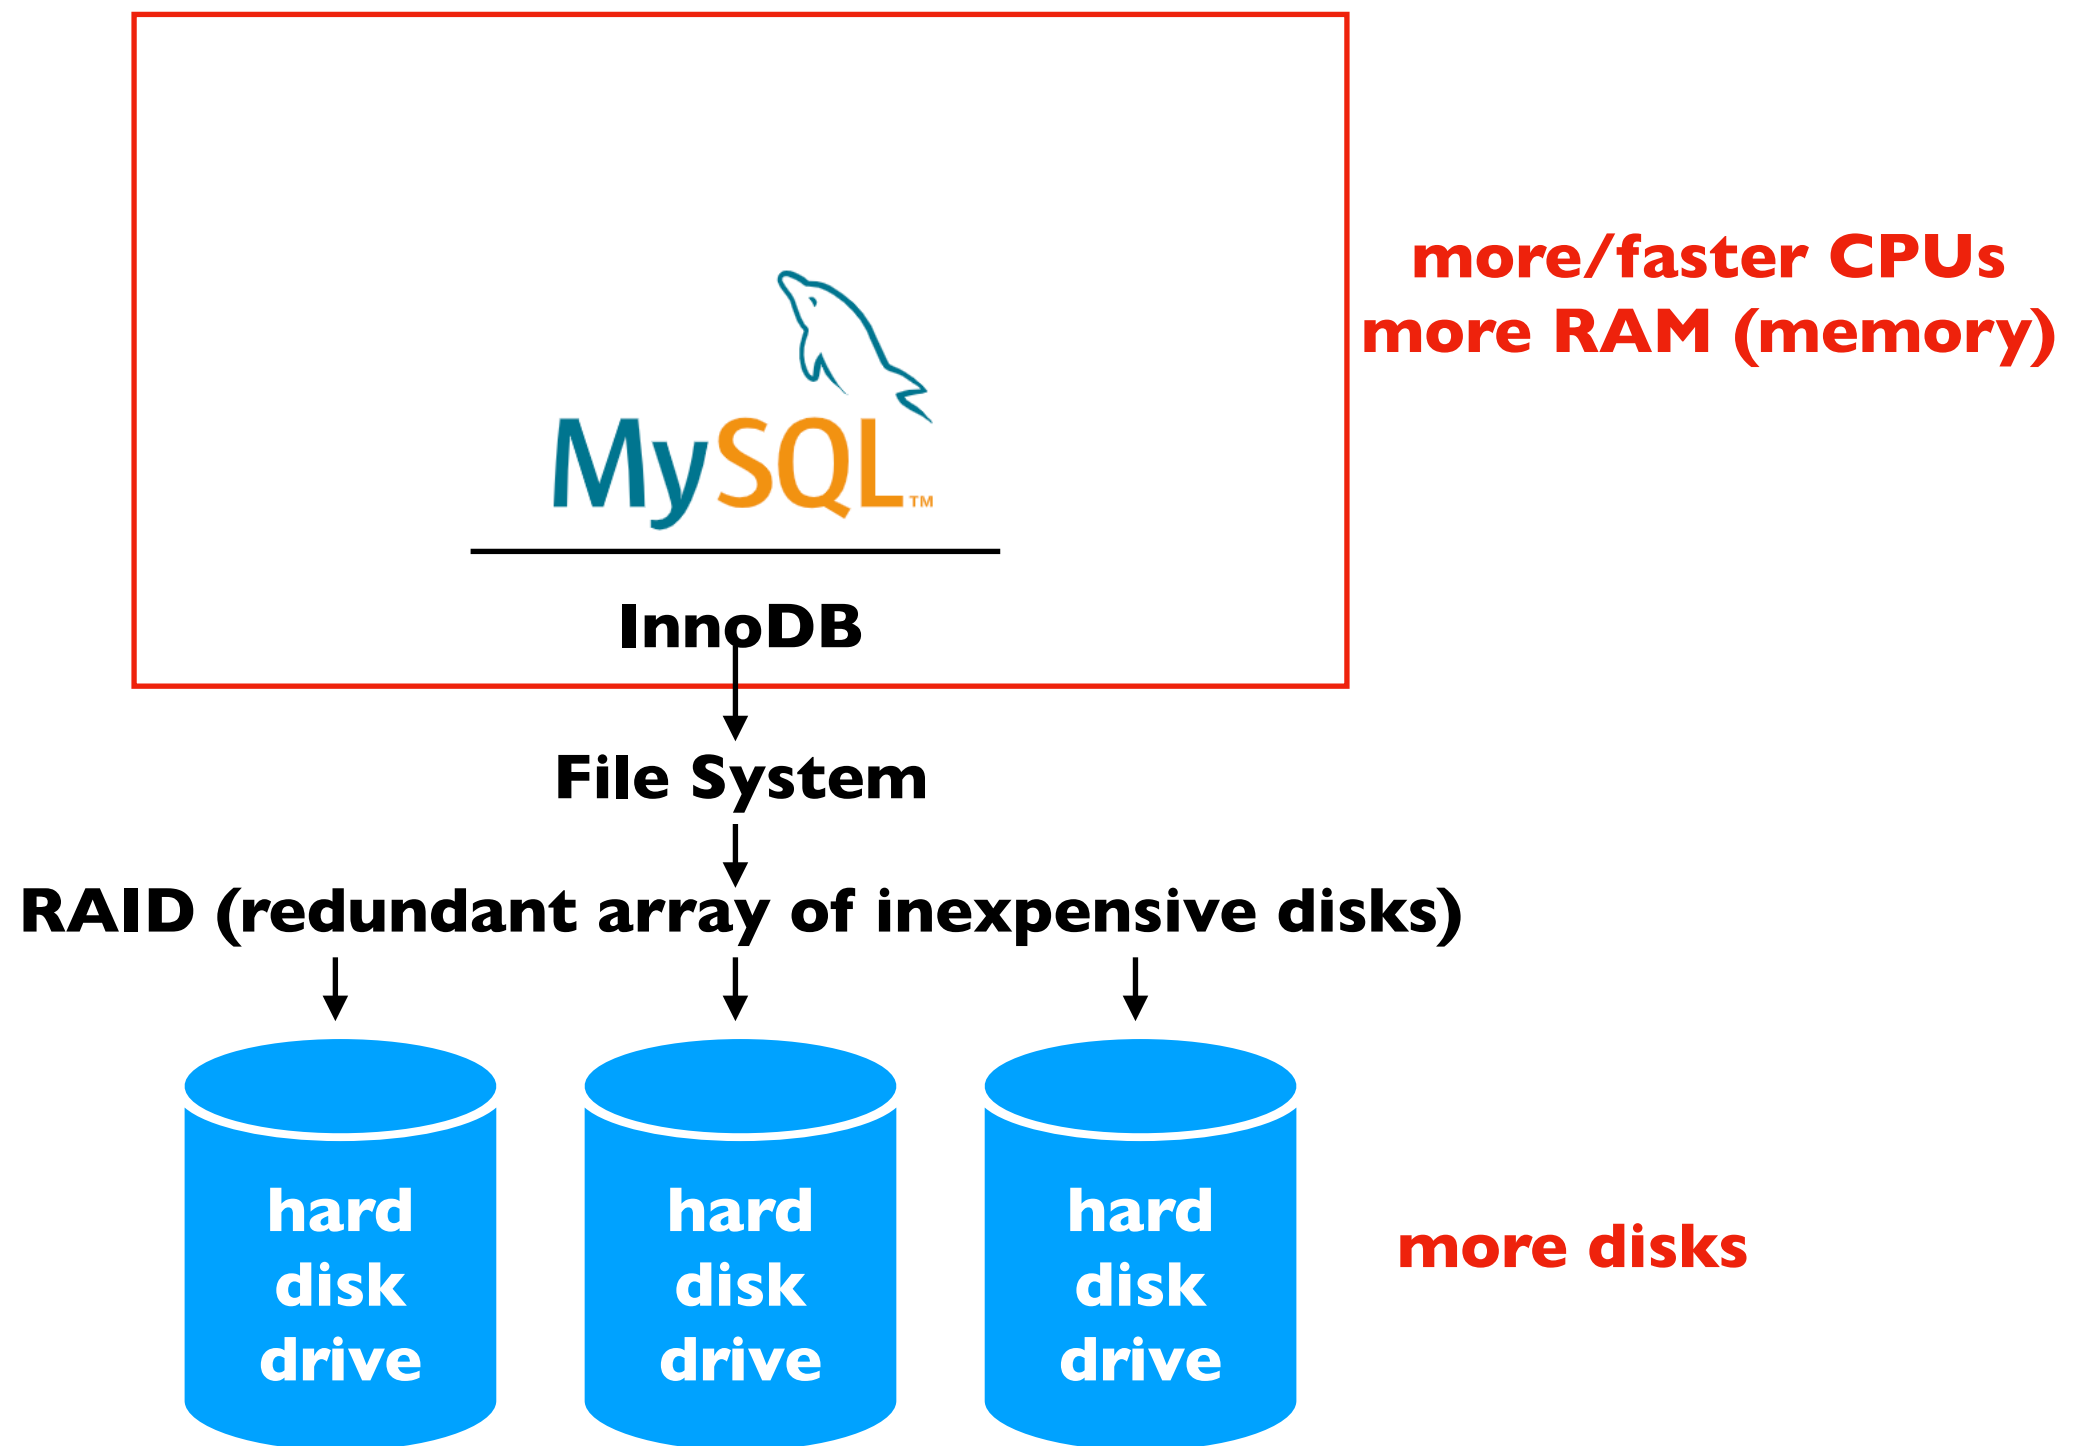

**Today: 3 layered systems
in the Hadoop Ecosystem**

What if your data is too big for your server?

What if your data is too big for your server?

Option 1: **scale up** (buy better hardware)

What if your data is too big for your server?

Option 2: **scale out** (more machines)

where does the data actually go?

Approach: **partition** the tables

tbl_users

user ID	name
1	"Yiyin"
2	"Ivan"
3	"Poulami"
...	

tbl_purchases

user ID	amt
2	\$10
2	\$15
3	\$20
...	

tbl_users

user ID	name
1	"Yiyin"
2	"Ivan"

tbl_purchases

user ID	amt
3	\$20
...	

tbl_users

user ID	name
3	"Poulami"
...	

tbl_purchases

user ID	amt
2	\$10
2	\$15

Approach: send queries to multiple DBs...

```
SELECT * FROM tbl_purchase WHERE amt > 12
```

tbl_users

user ID	name
1	"Yiyin"
2	"Ivan"

tbl_purchases

user ID	amt
3	\$20
...	

tbl_users

user ID	name
3	"Poulami"
...	

tbl_purchases

user ID	amt
2	\$10
2	\$15

...combine results

```
SELECT * FROM tbl_purchase WHERE amt > 12
```

tbl_purchases

user ID	amt
2	\$15
3	\$20

tbl_users

user ID	name
1	"Yiyin"
2	"Ivan"

tbl_purchases

user ID	amt
3	\$20
...	

tbl_users

user ID	name
3	"Poulami"
...	

tbl_purchases

user ID	amt
2	\$10
2	\$15

What is a query that would break things?

SELECT ...

tbl_users

user ID	name
1	"Yiyin"
2	"Ivan"

tbl_purchases

user ID	amt
3	\$20
...	

tbl_users

user ID	name
3	"Poulami"
...	

tbl_purchases

user ID	amt
2	\$10
2	\$15

What is a query that would break things?

```
SELECT * FROM tbl_users
INNER JOIN tbl_purchases
ON tbl_users.user_id = tbl_purchases.user_id
```

tbl_users

user ID	name
1	"Yiyin"
2	"Ivan"

tbl_purchases

user ID	amt
3	\$20
...	

tbl_users

user ID	name
3	"Poulami"
...	

tbl_purchases

user ID	amt
2	\$10
2	\$15

Why use a traditional/relational DB if basic things like JOIN don't easily work right at scale?

example: Cassandra documentation

STEP 3: CREATE FILES

The Cassandra Query Language (CQL) is very similar to SQL but suited for the JOINless structure of Cassandra.

https://cassandra.apache.org/_/quickstart.html

What if a server dies?

happens all the time when you have 1000s of machines

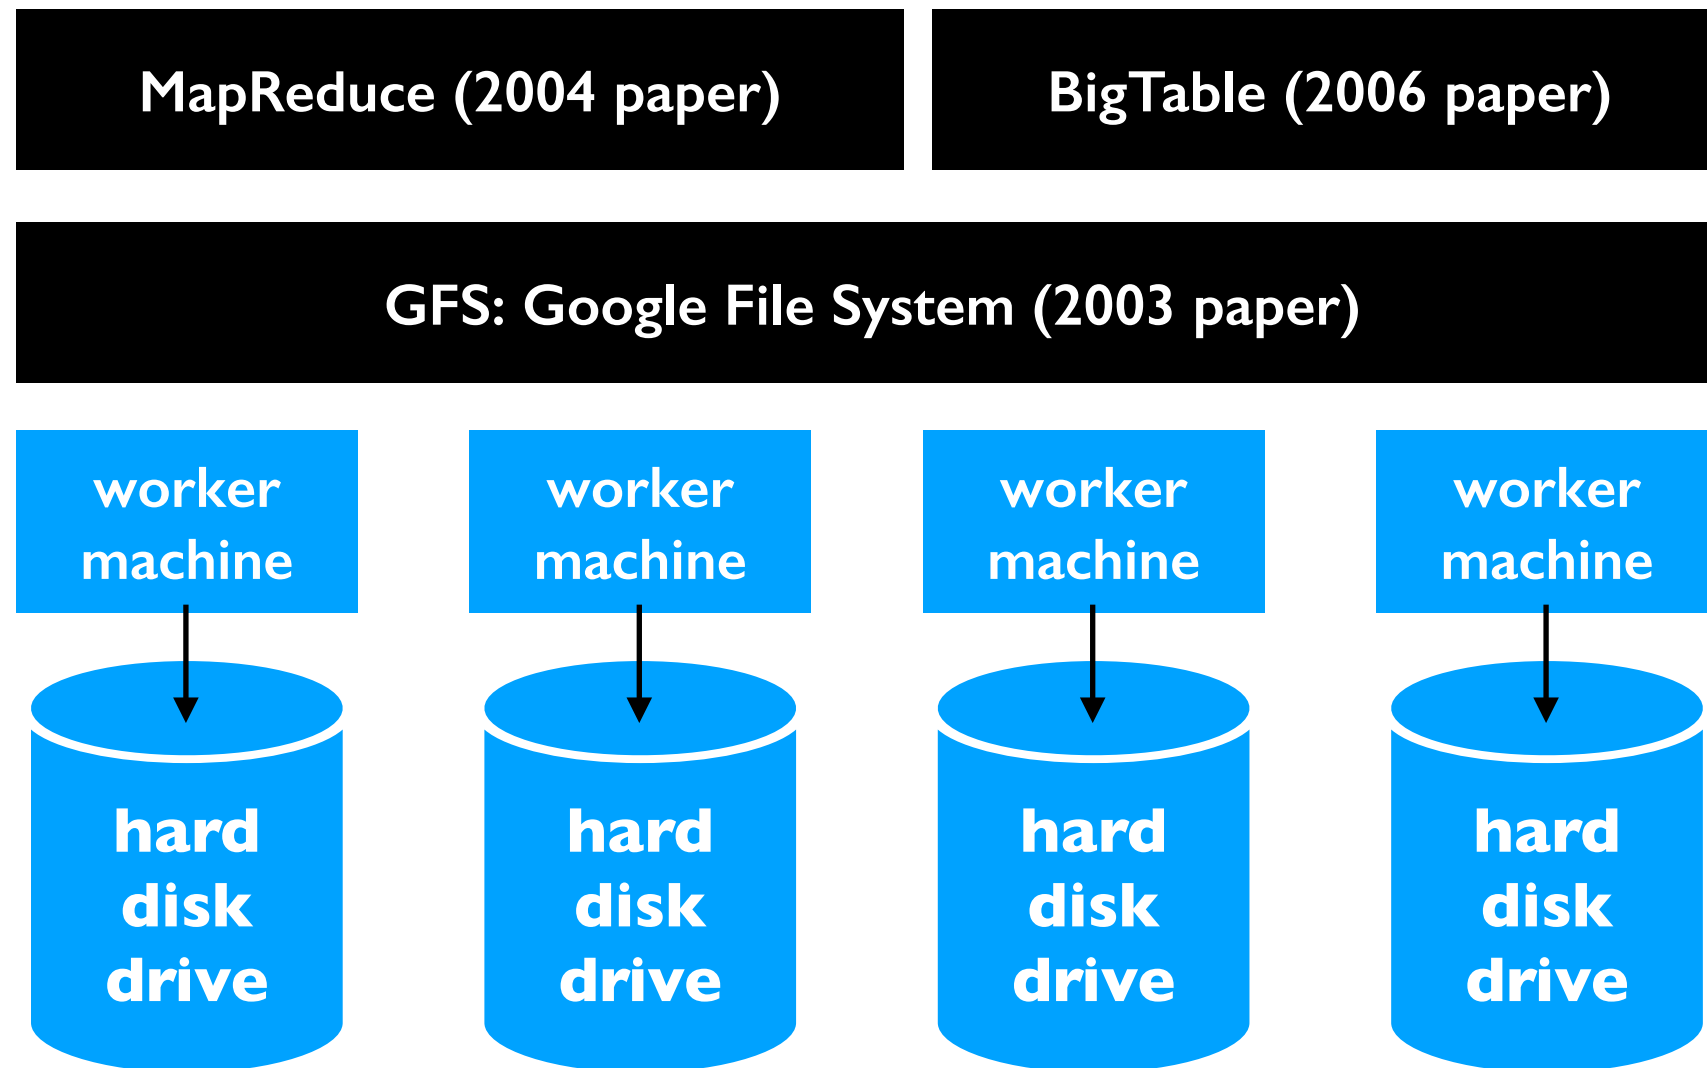

...1000s more...

Motivation for System Redesign

Features

- some classic features (like JOINS and transactions) may not be essential
- scaling to many machines is essential
- fault tolerance is essential

Google Architecture

radical idea: base everything on lots of cheap, commodity hardware

Hadoop Ecosystem

Yahoo, Facebook, Cloudera, and others developed open-source Hadoop ecosystem, mirroring Google's systems

	Google (paper only)	Hadoop, 1st gen (open source)	Modern Hadoop
Distributed File System	GFS	HDFS	
Distributed Analytics	MapReduce	Hadoop MapReduce	Spark
Distributed Database	BigTable	HBase	Cassandra

Ecosystem: Ambari, Avro, Cassandra, Chukwa, HBase, Hive, Mahout, Ozone, Pig, Spark, Submarine, Tez, ZooKeeper

<https://hadoop.apache.org/>

Outline: Hadoop Ecosystem

Motivation, Hadoop Ecosystem

Hadoop File System (HDFS)

HDFS: DataNodes store File Blocks

F1: "ABCD"

F2: "EFGHIJKL"

**DataNode
Computers**

HDFS: DataNodes store File Blocks

F1: "ABCD"

F2: "EFGHIJKL"

some files fit in a single block

**DataNode
Computers**

Partitioning Across DataNodes

F1: "ABCD"

F2: "EFGHIJKL"

bigger files are "partitioned"
across multiple DataNodes
(blocksize option)

**DataNode
Computers**

Replication Across DataNodes

F1: "ABCD"

3x replication

F2: "EFGHIJKL"

2x replication

**DataNode
Computers**

"ABCD" (F1.1)
"EFGH" (F2.1)

"ABCD" (F1.1)
"EFGH" (F2.1)
"IJKL" (F2.2)

"IJKL" (F2.2)
"ABCD" (F1.1)

Replication Across DataNodes

F1: "ABCD"

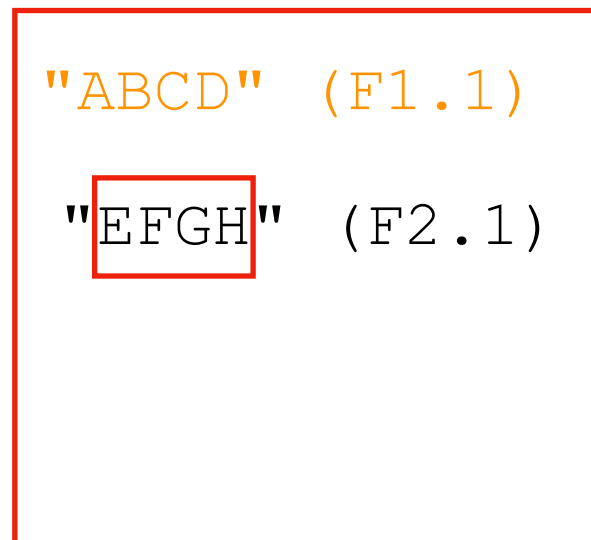

3x replication

F2: "EFGHIJKL"

2x replication

logical vs. physical blocks

**DataNode
Computers**

Replication Across DataNodes

F1: "ABCD"

3x replication

F2: "EFGHIJKL"

2x replication

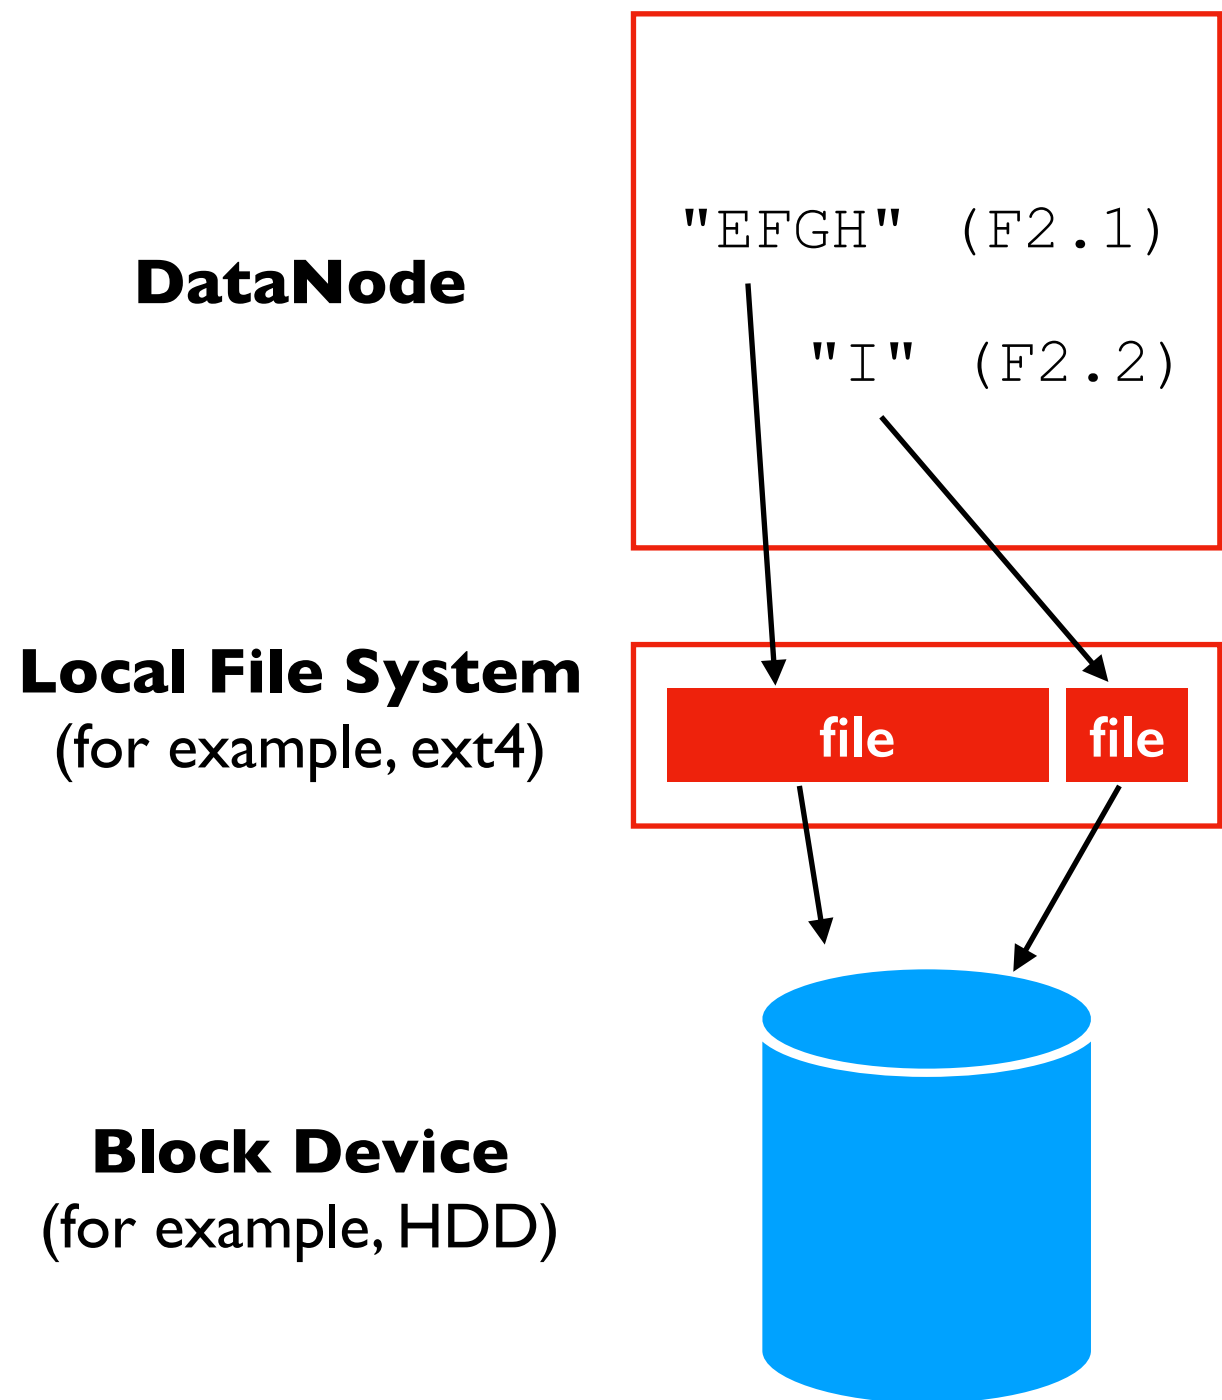

**if a DataNode dies, we still have all the data.
Which file (F1 or F2) is safer in general?**

**DataNode
Computers**

Physical HDFS Blocks Are Stored as Local Files

F2: "EFGHI"

**block size is specified
per HDFS file**

**this will cap the size of
the local files**

example: 64 MB block size,
and 67 MB file. Block 1 will be
stored in 64 MB file, and block
2 will be stored in a 3 MB file.
The second block isn't wasting
space just because it is much
smaller than the block size.

Aside: Replication vs. Erasure Encoding

HDFS Strategies for handling node failure

Replication

- original strategy, used for new/hot data
- covered in CS 544

Erasure Encoding

- more space efficient, less I/O efficient
- recent HDFS feature used for cold data (NOT covered in CS 544)

<https://hadoop.apache.org/docs/stable/hadoop-project-dist/hadoop-hdfs/HDFSErasureCoding.html>

Boss (NameNode)/Worker Architecture

My Laptop

client program

NameNode

F1.1: nodes 1, 2, 3

F2.1: nodes 1, 2

F2.2: nodes 2, 3

**I want to
read F2**

**DataNode

Pipelined Writes

My Laptop

client program

"xyz"

NameNode

F1.1: nodes 1, 2, 3

F2.1: nodes 1, 2

F2.2: nodes 2, 3

F3.1: nodes 1, 2, 3

DataNode Computers

"ABCD" (F1.1)

"EFGH" (F2.1)

"XYZ" (F3.1)

DN1

"ABCD" (F1.1)

"EFGH" (F2.1)

"IJKL" (F2.2)

"XYZ" (F3.1)

DN2

"IJKL" (F2.2)

"ABCD" (F1.1)

"XYZ" (F3.1)

DN3

How are reads/writes amplified at disk level?

if a client **writes** 4 MB to a 2x replicated file, how much data do we **write** to hard drives?

if a client **reads** 2 MB to a 3x replicated file, how much data do we **read** from hard drives?

NameNode

F1.1: nodes 1, 2, 3

F2.1: nodes 1, 2

F2.2: nodes 2, 3

F3.1: nodes 1, 2, 3

DataNode Computers

"ABCD" (F1.1)

"EFGH" (F2.1)

"XYZ" (F3.1)

DN1

"ABCD" (F1.1)

"EFGH" (F2.1)

"IJKL" (F2.2)

"XYZ" (F3.1)

DN2

"IJKL" (F2.2)

"ABCD" (F1.1)

"XYZ" (F3.1)

DN3

What are the tradeoffs of replication factor and block size?

NameNode

benefits of high replication?

benefits of low replication?

benefits of large block size?

benefits of small block size?

F1.1: nodes 1, 2, 3

F2.1: nodes 1, 2

F2.2: nodes 2, 3

F3.1: nodes 1, 2, 3

DataNode Computers

"ABCD" (F1.1)

"EFGH" (F2.1)

"XYZ" (F3.1)

DN1

"ABCD" (F1.1)

"EFGH" (F2.1)

"IJKL" (F2.2)

"XYZ" (F3.1)

DN2

"IJKL" (F2.2)

"ABCD" (F1.1)

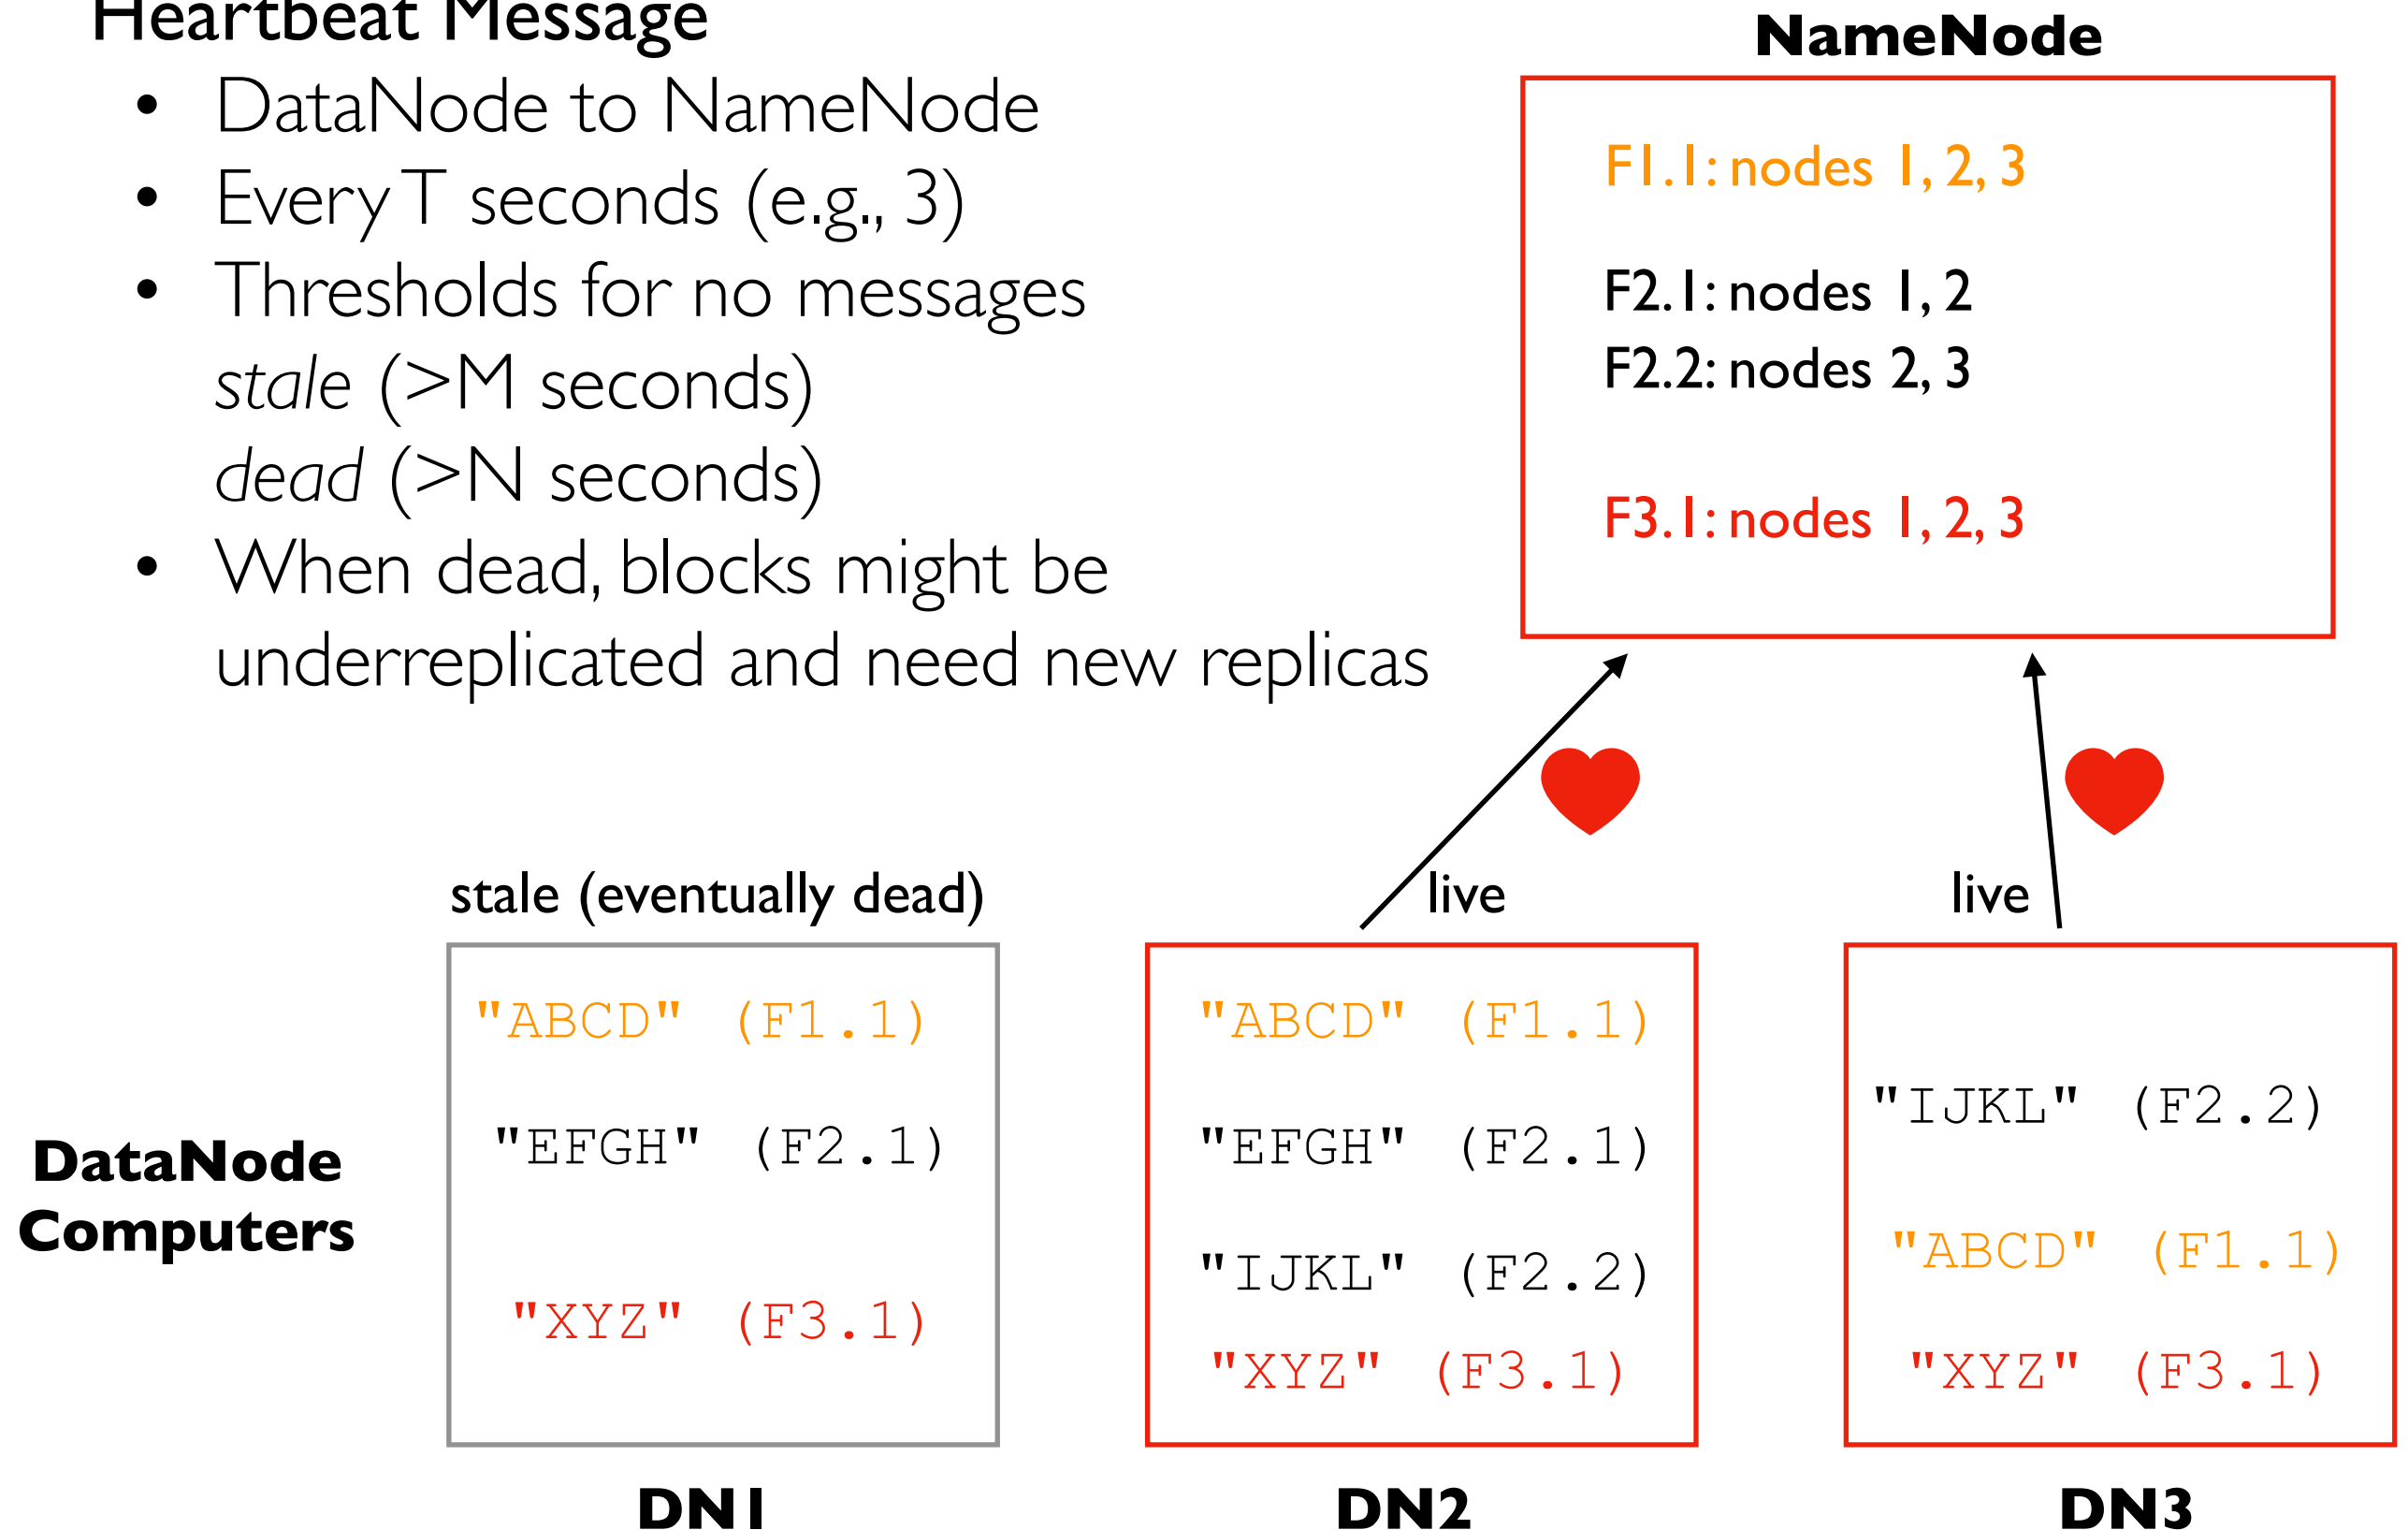

"XYZ" (F3.1)

DN3

How do we know when a DataNode fails?

Heartbeat Message

- DataNode to NameNode
- Every T seconds (e.g., 3)
- Thresholds for no messages
stale (>M seconds)
dead (>N seconds)
- When dead, blocks might be underreplicated and need new replicas

Summary: Some Key Ideas Applied to HDFS

To build complex systems...

- compose layers of subsystems

To scale out...

- partition your data

To handle faults...

- replicate your data

To detect faults...

- send heartbeats

To optimize I/O...

- pipeline writes
