Meena Syamkumar  
Andy Kuemmel

# Learning Objectives Today

## CSV format

- purpose
- syntax
- comparison to spreadsheet

## Reading CSV files

- without header
- with header
- type casting

Chapter 16 of Sweigart, to (and including)  
“Reading Data from Reader Objects in a for Loop”

# Today's Outline

Spreadsheets

CSVs

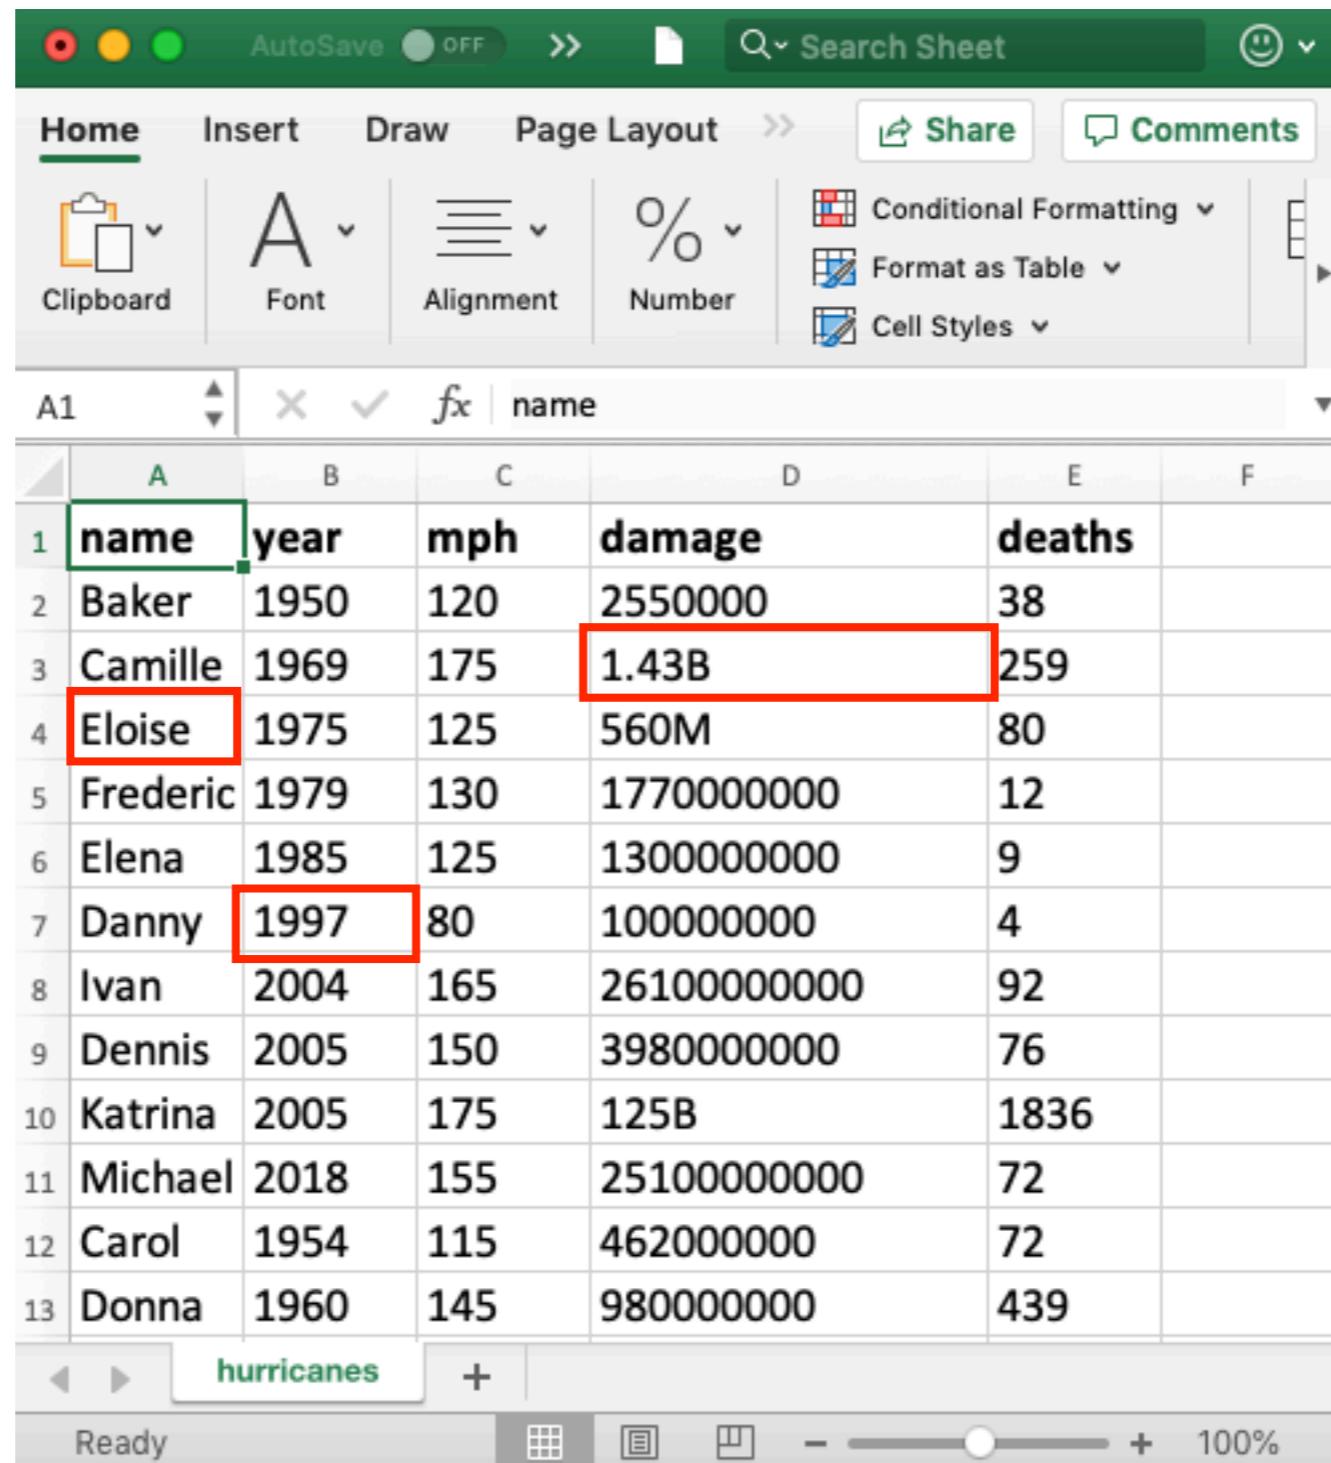

Reading a CSV to a list of lists

Coding examples

# Spreadsheets (e.g., Excel)

Spreadsheets are tables of cells, organized by rows and columns

cells

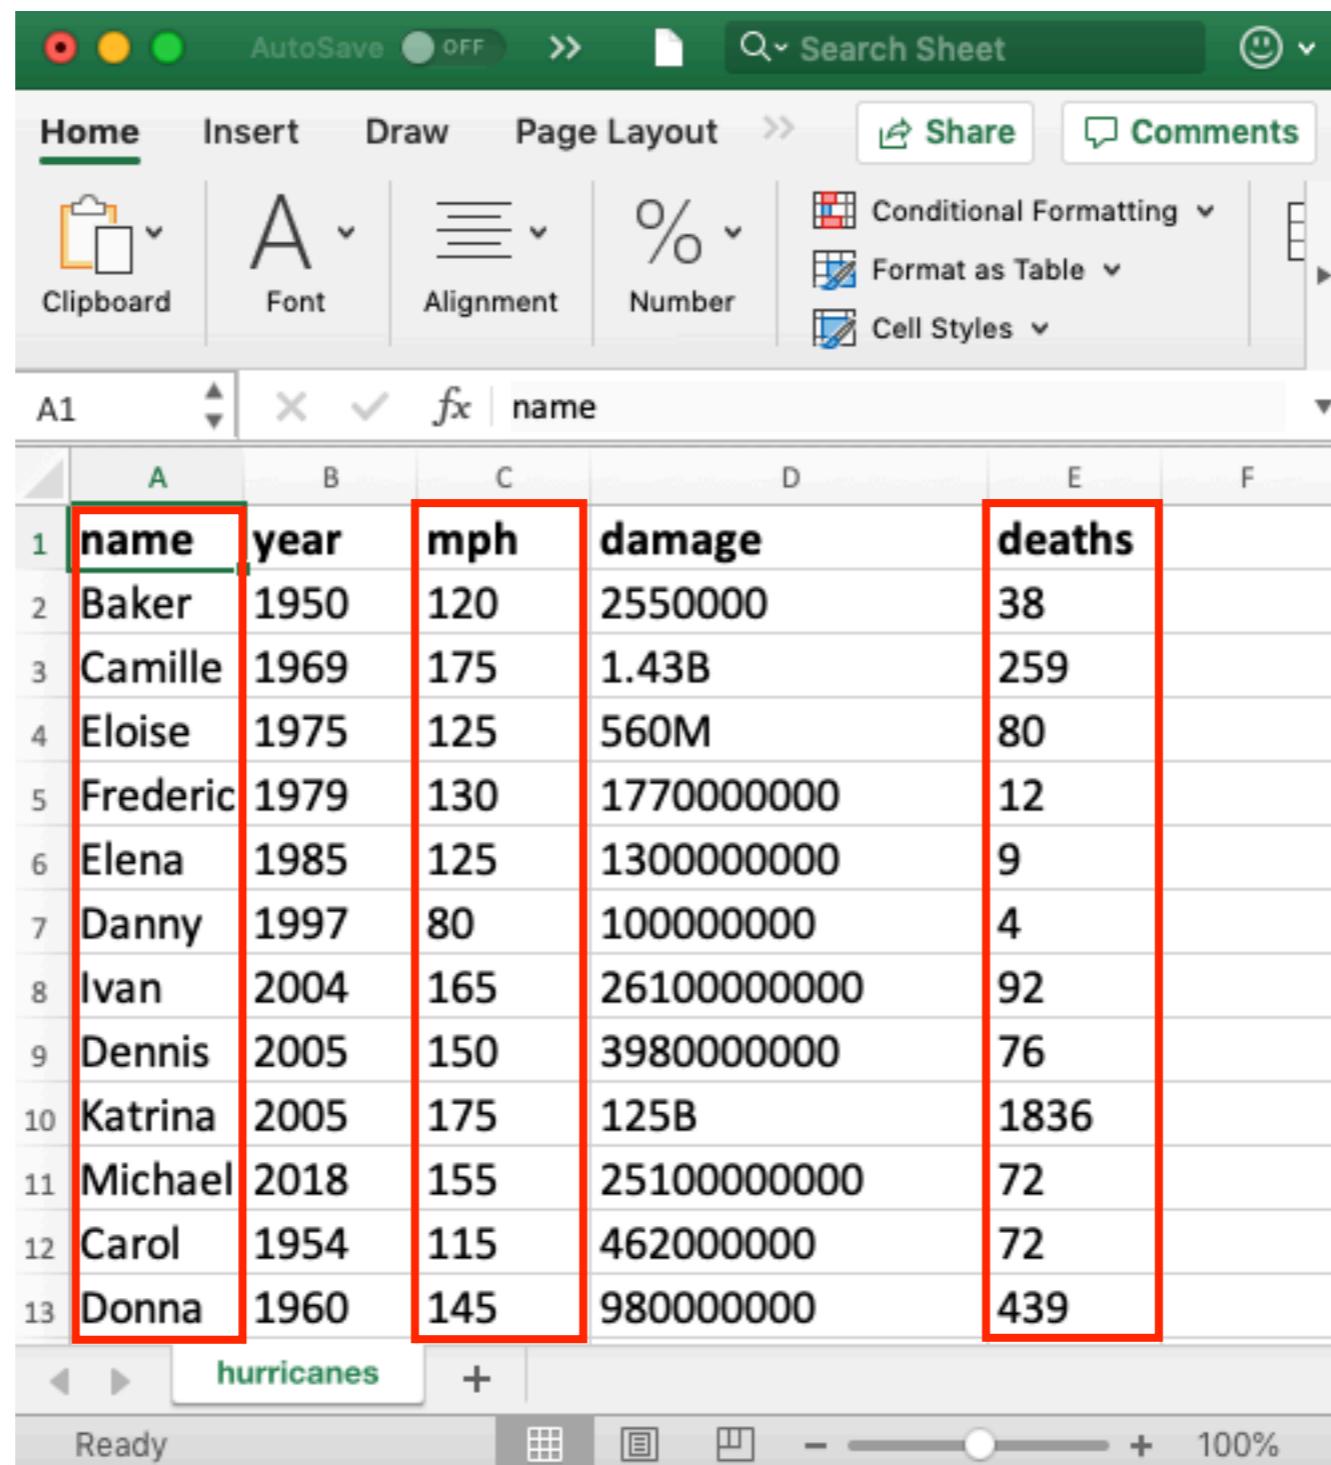

The screenshot shows a Microsoft Excel spreadsheet titled "Search Sheet". The ribbon menu is visible at the top, with "Home" selected. The formula bar shows "A1" and "name". The main area contains a table with 13 rows and 6 columns. The columns are labeled "name", "year", "mph", "damage", and "deaths". The first row is a header. The "name" column has a green border around the first cell ("name"). The "deaths" column has a red border around the second cell ("38"). The "name" column has a red border around the fourth cell ("Eloise"). The "damage" column has a red border around the third cell ("1.43B"). The "year" column has a red border around the seventh cell ("1997"). The "damage" column has a red border around the eleventh cell ("25100000000"). The "deaths" column has a red border around the twelfth cell ("72"). The "name" column has a red border around the thirteenth cell ("Donna"). The "deaths" column has a red border around the thirteenth cell ("439"). The table is named "hurricanes".

	A	B	C	D	E	F
1	<b>name</b>	<b>year</b>	<b>mph</b>	<b>damage</b>	<b>deaths</b>	
2	Baker	1950	120	2550000	38	
3	Camille	1969	175	1.43B	259	
4	Eloise	1975	125	560M	80	
5	Frederic	1979	130	1770000000	12	
6	Elena	1985	125	1300000000	9	
7	Danny	1997	80	100000000	4	
8	Ivan	2004	165	26100000000	92	
9	Dennis	2005	150	3980000000	76	
10	Katrina	2005	175	125B	1836	
11	Michael	2018	155	25100000000	72	
12	Carol	1954	115	462000000	72	
13	Donna	1960	145	980000000	439	

# Spreadsheets (e.g., Excel)

Spreadsheets are tables of cells, organized by rows and columns

columns

The screenshot shows a Microsoft Excel spreadsheet titled "hurricanes". The table has 13 rows and 6 columns. The columns are labeled "name", "year", "mph", "damage", and "deaths". The first row contains the column headers. The "name" column is highlighted with a green border, while the other four columns are highlighted with red borders. The data includes information about various hurricanes like Baker, Camille, Eloise, Frederic, Elena, Danny, Ivan, Dennis, Katrina, Michael, Carol, and Donna, along with their respective years, speeds, damages, and death tolls.

	A	B	C	D	E	F
1	name	year	mph	damage	deaths	
2	Baker	1950	120	2550000	38	
3	Camille	1969	175	1.43B	259	
4	Eloise	1975	125	560M	80	
5	Frederic	1979	130	1770000000	12	
6	Elena	1985	125	1300000000	9	
7	Danny	1997	80	100000000	4	
8	Ivan	2004	165	26100000000	92	
9	Dennis	2005	150	3980000000	76	
10	Katrina	2005	175	125B	1836	
11	Michael	2018	155	25100000000	72	
12	Carol	1954	115	462000000	72	
13	Donna	1960	145	980000000	439	

# Spreadsheets (e.g., Excel)

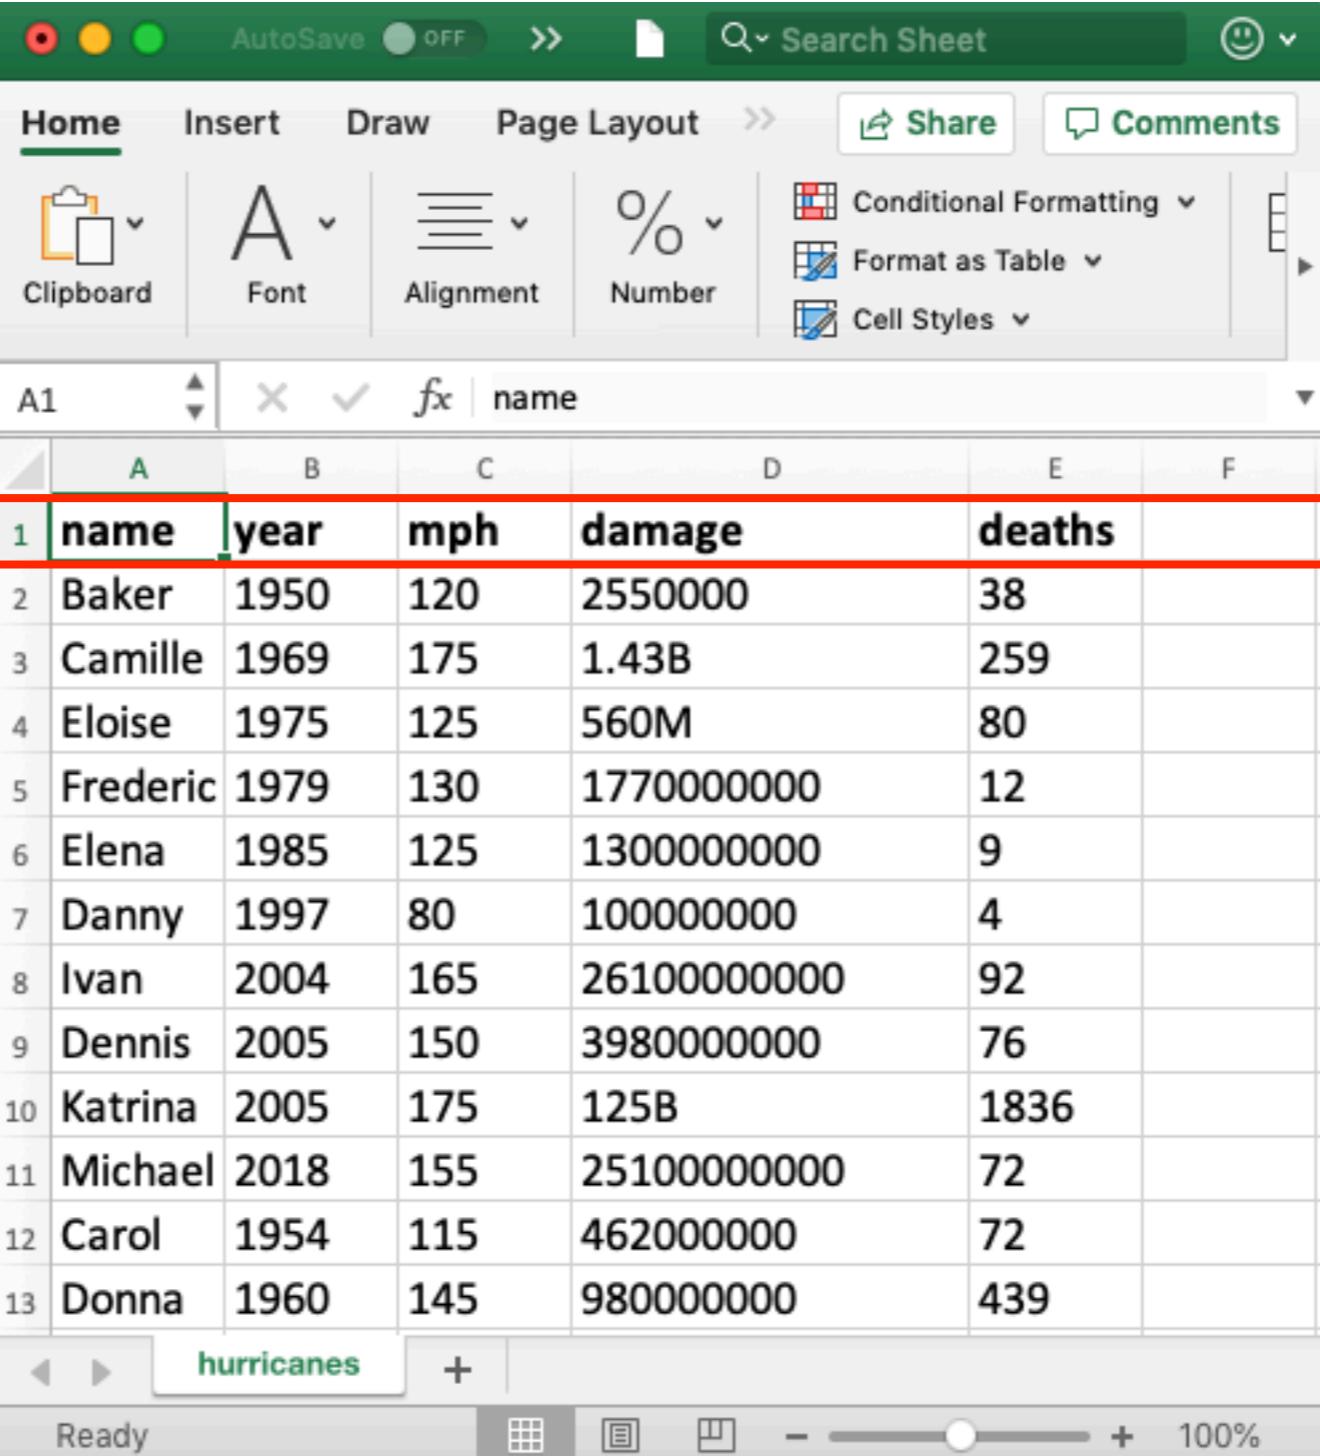

Spreadsheets are tables of cells, organized by rows and columns

rows

	A	B	C	D	E	F
1	name	year	mph	damage	deaths	
2	Baker	1950	120	2550000	38	
3	Camille	1969	175	1.43B	259	
4	Eloise	1975	125	560M	80	
5	Frederic	1979	130	1770000000	12	
6	Elena	1985	125	1300000000	9	
7	Danny	1997	80	100000000	4	
8	Ivan	2004	165	26100000000	92	
9	Dennis	2005	150	3980000000	76	
10	Katrina	2005	175	125B	1836	
11	Michael	2018	155	25100000000	72	
12	Carol	1954	115	462000000	72	
13	Donna	1960	145	980000000	439	

# Spreadsheets (e.g., Excel)

Spreadsheets are tables of cells, organized by rows and columns

The screenshot shows a Microsoft Excel spreadsheet titled "Search Sheet". The ribbon menu is visible at the top, with "Home" selected. The formula bar shows "A1" and "name". The main area contains a table of data with the first row highlighted in red. The word "header" is written in red text to the left of the first row. The table has columns labeled "name", "year", "mph", "damage", and "deaths". The data rows are numbered 1 through 13. The "damage" column contains large values such as "2550000", "1.43B", and "1770000000". The "deaths" column contains values like "38", "259", and "1836". The bottom of the screen shows the status bar with "Ready" and various icons.

1	name	year	mph	damage	deaths
2	Baker	1950	120	2550000	38
3	Camille	1969	175	1.43B	259
4	Eloise	1975	125	560M	80
5	Frederic	1979	130	1770000000	12
6	Elena	1985	125	1300000000	9
7	Danny	1997	80	100000000	4
8	Ivan	2004	165	26100000000	92
9	Dennis	2005	150	3980000000	76
10	Katrina	2005	175	125B	1836
11	Michael	2018	155	25100000000	72
12	Carol	1954	115	462000000	72
13	Donna	1960	145	980000000	439

# Spreadsheets (e.g., Excel)

Spreadsheets often allow different **data types**

	A	B	C	D	E	F
1	<b>name</b>	<b>year</b>	<b>mph</b>	<b>damage</b>	<b>deaths</b>	
2	Baker	1950	120	2550000	38	
3	Camille	1969	175	1.43B	259	
4	Eloise	1975	125	560M	80	
5	Frederic	1979	130	1770000000	12	
6	Elena	1985	125	1300000000	9	
7	Danny	1997	80	100000000	4	
8	Ivan	2004	165	26100000000	92	
9	Dennis	2005	150	3980000000	76	
10	Katrina	2005	175	125B	1836	
11	Michael	2018	155	25100000000	72	
12	Carol	1954	115	462000000	72	
13	Donna	1960	145	980000000	439	

# Spreadsheets (e.g., Excel)

Spreadsheets often allow different **fonts**

The screenshot shows a Microsoft Excel spreadsheet titled "Search Sheet". The ribbon is visible at the top with tabs for Home, Insert, Draw, and Page Layout. The Home tab is selected. The formula bar shows "A1" and the text "name". The main area contains a table with 13 rows and 6 columns. The columns are labeled "name", "year", "mph", "damage", and "deaths". The first row is bolded. The second row is regular. Red arrows point from the word "bold" to the first row and from the word "regular" to the second row. The table data is as follows:

	A	B	C	D	E	F
1	<b>name</b>	<b>year</b>	<b>mph</b>	<b>damage</b>	<b>deaths</b>	
2	Baker	1950	120	2550000	38	
3	Camille	1969	175	1.43B	259	
4	Eloise	1975	125	560M	80	
5	Frederic	1979	130	1770000000	12	
6	Elena	1985	125	1300000000	9	
7	Danny	1997	80	100000000	4	
8	Ivan	2004	165	26100000000	92	
9	Dennis	2005	150	3980000000	76	
10	Katrina	2005	175	125B	1836	
11	Michael	2018	155	25100000000	72	
12	Carol	1954	115	462000000	72	
13	Donna	1960	145	980000000	439	

The bottom of the screen shows the status bar with "Ready" and various icons, and the zoom level is set to 100%.

# Spreadsheets (e.g., Excel)

Spreadsheets often support **multiple sheets**

A screenshot of a Microsoft Excel spreadsheet titled "Search Sheet". The ribbon menu is visible at the top, showing "Home" as the active tab. The main area displays a table with 13 rows and 6 columns. The columns are labeled "name", "year", "mph", "damage", and "deaths". The first row contains the column headers. The data includes entries for Baker (1950), Camille (1969), Eloise (1975), Frederic (1979), Elena (1985), Danny (1997), Ivan (2004), Dennis (2005), Katrina (2005), Michael (2018), Carol (1954), and Donna (1960). The "damage" column contains large values like 2550000 and 1770000000. The "deaths" column contains values like 38, 259, 80, 12, 9, 4, 92, 76, 1836, 72, 72, and 439. The bottom of the screen shows the status bar with "Ready" and various icons, and a red box highlights the "+" button next to the sheet tabs, which is labeled "hurricanes". A red arrow points from this button to the text "more tables of data" located on the right side of the slide.

	A	B	C	D	E	F
1	<b>name</b>	<b>year</b>	<b>mph</b>	<b>damage</b>	<b>deaths</b>	
2	Baker	1950	120	2550000	38	
3	Camille	1969	175	1.43B	259	
4	Eloise	1975	125	560M	80	
5	Frederic	1979	130	1770000000	12	
6	Elena	1985	125	1300000000	9	
7	Danny	1997	80	100000000	4	
8	Ivan	2004	165	26100000000	92	
9	Dennis	2005	150	3980000000	76	
10	Katrina	2005	175	125B	1836	
11	Michael	2018	155	25100000000	72	
12	Carol	1954	115	462000000	72	
13	Donna	1960	145	980000000	439	

more tables of data

# Excel Files

Extension: .xlsx

Format: **binary** → just 0's and 1's, not human-readable characters.  
Need special software...

Writing code to read data from Excel files is tricky, unless you use special modules

# Today's Outline

Spreadsheets

CSVs

Reading a CSV to a list of lists

Coding examples

# CSVs

CSV is a simple data format that stands for  
**Comma-Separated Values**

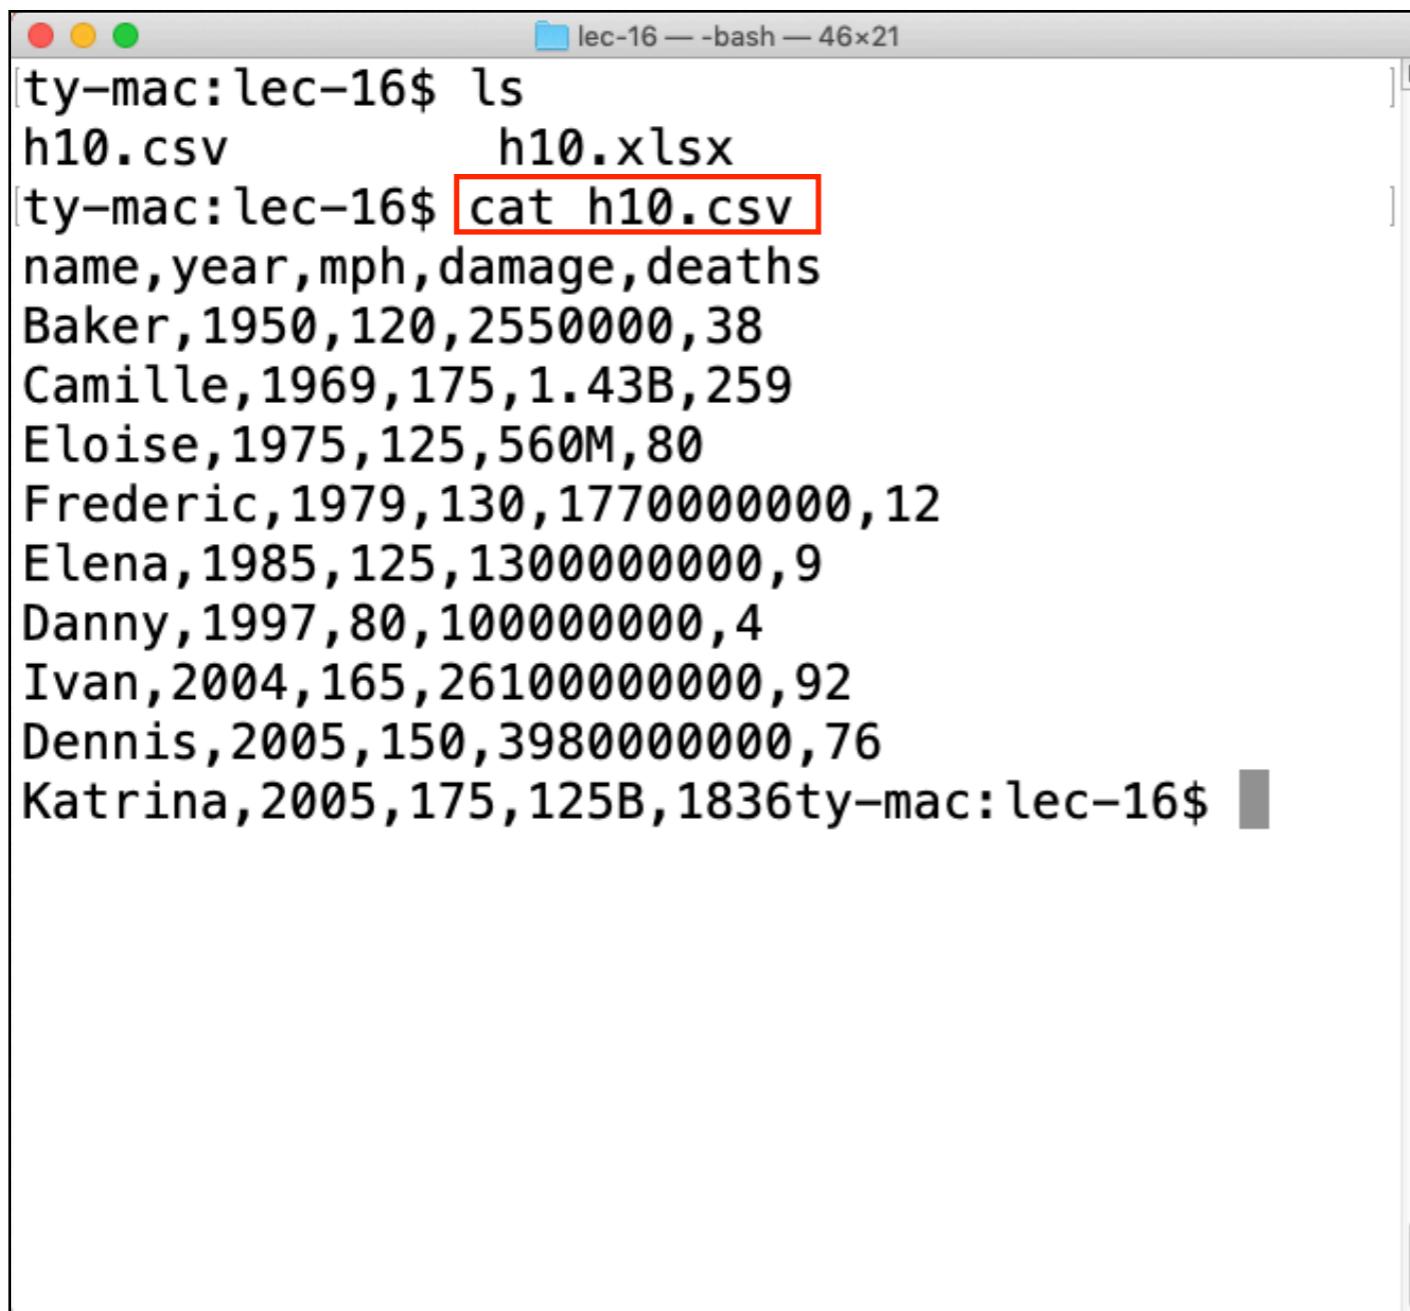

CSVs are like simple spreadsheets

- organize cells of data into rows and columns
  - only one sheet per file
  - only holds strings
  - no way to specify font, borders, cell size, etc
- you'll do lots of type casting/conversion!
- 

# CSV Files

Extension: .csv

Format: plain text → just open in any editor (notepad, textedit, idle, etc)  
and you'll be able to read it

A screenshot of a Mac OS X terminal window titled "lec-16 — bash — 46x21". The window shows the command line interface with the following text:

```
[ty-mac:lec-16$ ls
h10.csv      h10.xlsx
[ty-mac:lec-16$ cat h10.csv
name,year,mph,damage,deaths
Baker,1950,120,2550000,38
Camille,1969,175,1.43B,259
Eloise,1975,125,560M,80
Frederic,1979,130,1770000000,12
Elena,1985,125,1300000000,9
Danny,1997,80,100000000,4
Ivan,2004,165,2610000000,92
Dennis,2005,150,3980000000,76
Katrina,2005,175,125B,1836
ty-mac:lec-16$ ]
```

The word "cat h10.csv" is highlighted with a red box and an arrow points from it to the explanatory text above.

Writing code that understands  
CSV files is easy

# Basic Syntax

## Table

Name	Date	Time	Status	Latitude	Longitude	WindSpeed	Ocean

EMMY,19/60820,1200, TD,14.0N,48.0W,20,Atlantic

Newlines delimit rows

The comma is a delimiter between cells in a row

... are separated by commas

# Advanced Syntax

We won't go into details here, but there are some complexities

Motivation for more complicated syntax

- *what if a cell contains a newline?*
- *what if we want a comma inside a cell?*
- *what if a cell contains a quote?*
- *what if we want to use different delimiters between rows/cells?*

usually better to use a general CSV module than roll your own

Reading a CSV to a list of lists

Coding examples

# Demo 1: Restaurant Location Lookup

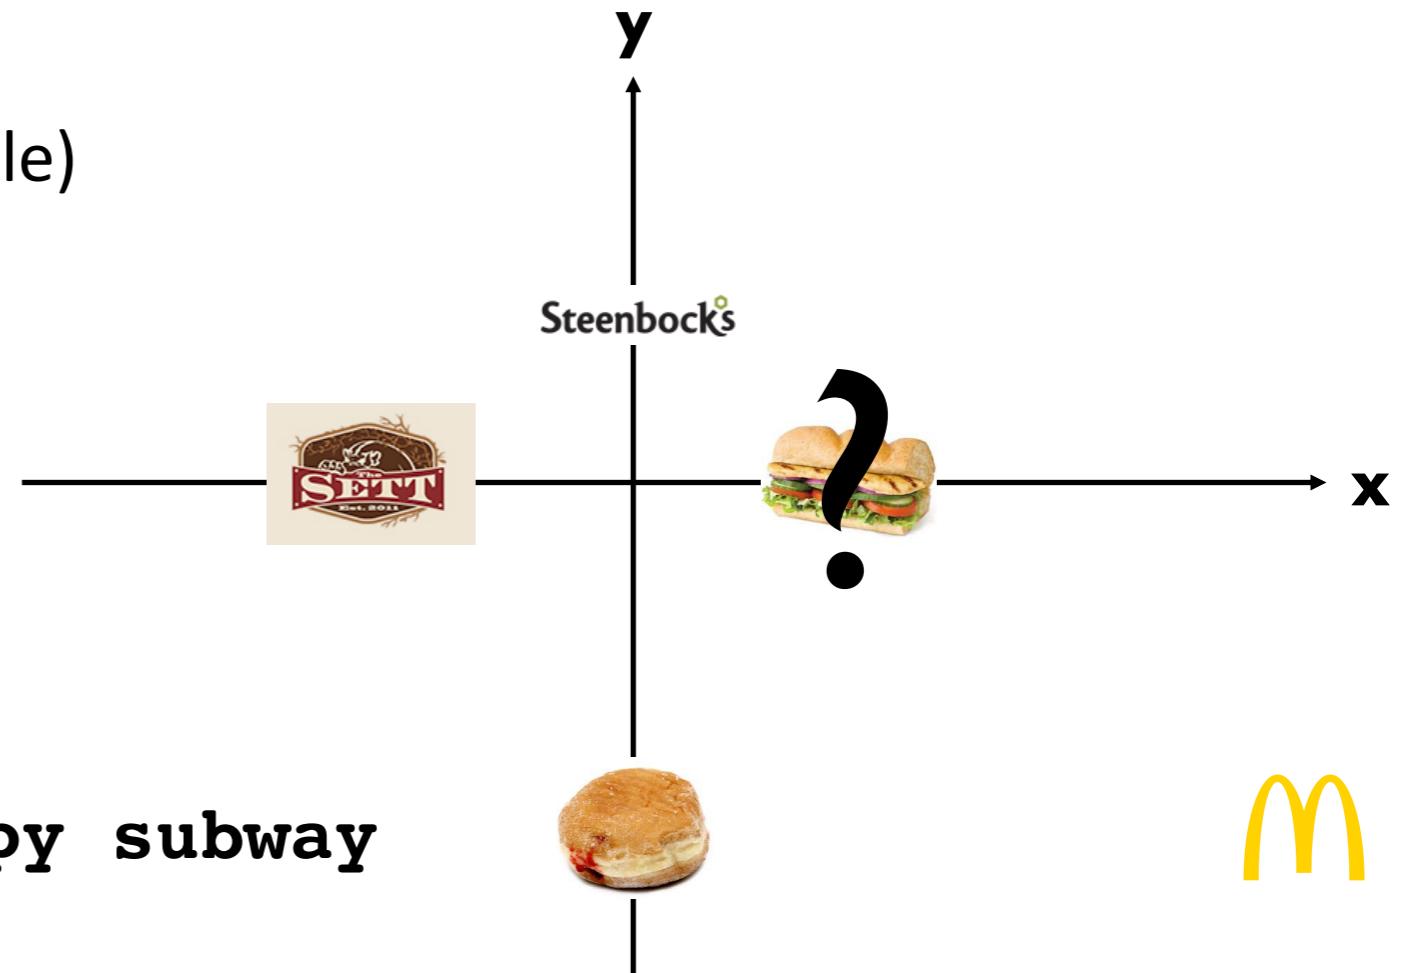

**Goal:** given a restaurant name, give x,y coordinates for it

## **Input:**

- Restaurant name (and a CSV file)

## **Output:**

- X, Y coordinates

## **Example:**

```
prompt> python rlookup.py subway  
x=1, y=0  
prompt> python rlookup.py mcdonalds  
x=4, y=-3
```

# Demo 2: Nearest Restaurant Search

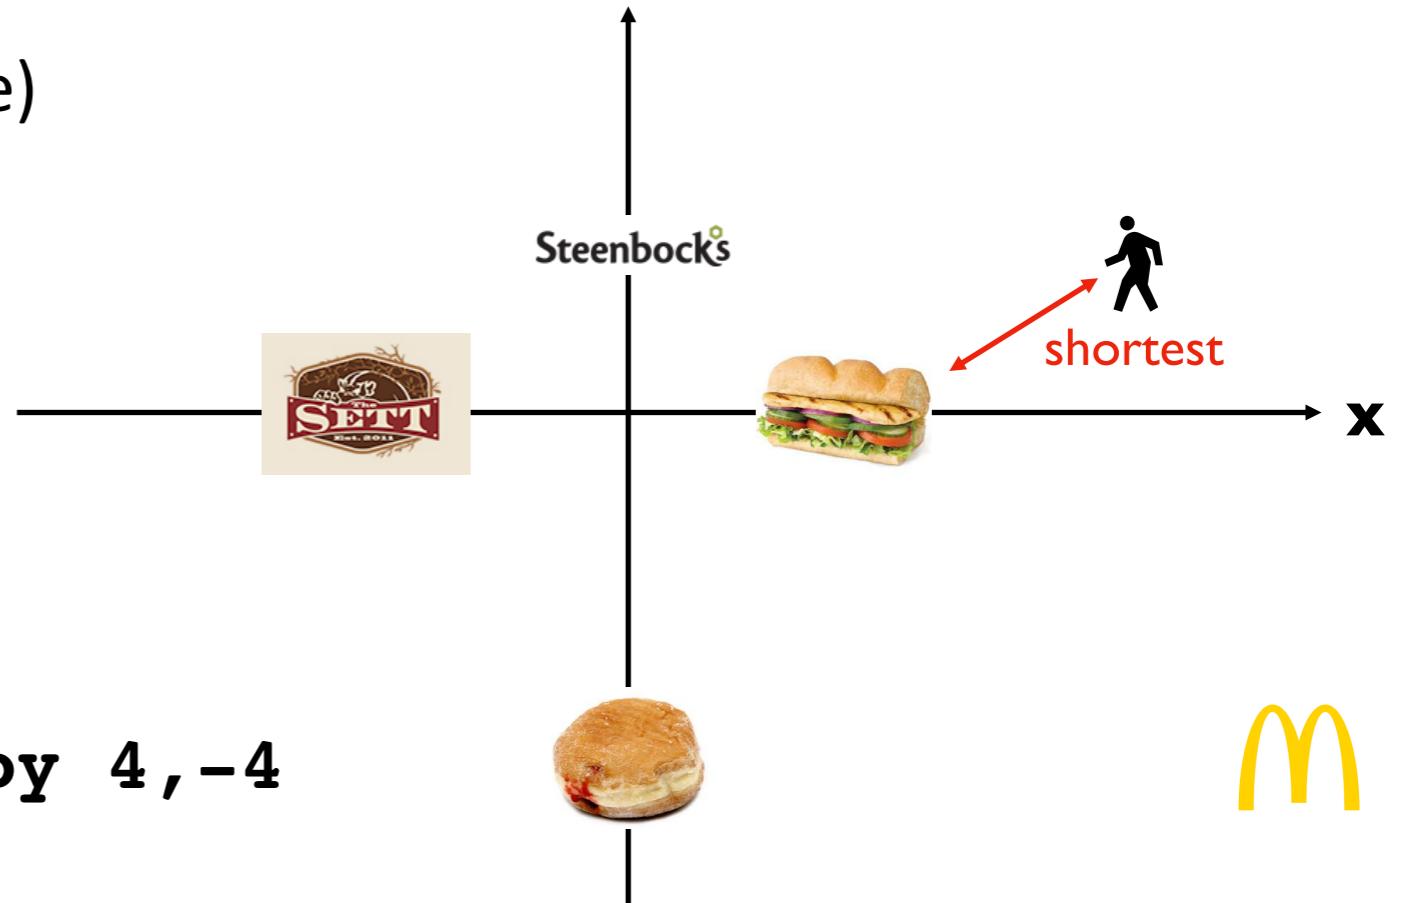

Goal: given a location, find the nearest restaurant

## Input:

- X, Y coordinates (and a CSV file)

## Output:

- nearest restaurant

## Example:

```
prompt> python nearest.py 4,-4
```

McDonalds

```
prompt> python nearest.py -2,0
```

The Sett

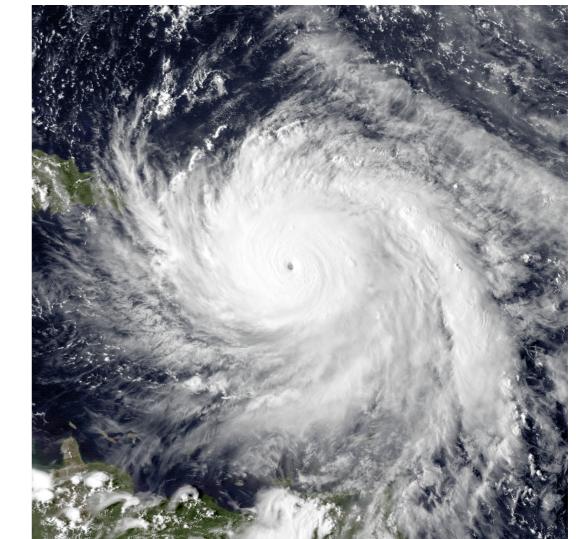

# Demo 3: Hurricane Column Dump

**Goal:** column name, print that data for all hurricanes

## **Input:**

- column name (and a CSV file)

## **Output:**

- data in given column, associated with name

## **Example:**

```
prompt> python dump.py hurricanes.csv year
```

```
Baker: 1950
```

```
Camille: 1969
```

```
Eloise: 1975
```

```
...
```

# Demo 4: Hurricanes per Year

Goal: column name, print that data for all hurricanes

## Input:

- none typed (only a CSV file)

## Output:

- the number of hurricanes in each year

## Example:

```
prompt> python yearly.py
```

```
1967: 23
```

```
1968: 29
```

```
1969: 15
```

```
...
```

Denny Sanford School of Social and Family Dynamics, Arizona State University, Tempe, AZ 85287-3701

Edited\* by Susan T. Fiske, Princeton University, Princeton, NJ, and approved May 14, 2014 (received for review February 13, 2014)

**Do people judge hurricane risks in the context of gender-based expectations? We use more than six decades of death rates from US hurricanes to show that feminine-named hurricanes cause significantly more deaths than do masculine-named hurricanes. Laboratory experiments indicate that this is because hurricane names lead to gender-based expectations about severity and this, in turn, guides respondents' preparedness to take protective action. This finding indicates an unfortunate and unintended consequence of the gendered naming of hurricanes, with important implications for policymakers, media practitioners, and the general public concerning hurricane communication and preparedness.**

gender stereotypes | implicit bias | risk perception | natural hazard communication | bounded rationality

violence and destruction (23, 24). We extend these findings to hypothesize that the anticipated severity of a hurricane with a masculine name (Victor) will be greater than that of a hurricane with a feminine name (Victoria). This expectation, in turn, will affect the protective actions that people take. As a result, a hurricane with a feminine vs. masculine name will lead to less protective action and more fatalities.

**Archival Study**

To test this hypothesis, we used archival data on actual fatalities caused by hurricanes in the United States (1950–2012). Ninety-four Atlantic hurricanes made landfall in the United States during this period (25). Nine independent coders who were blind to the hypothesis rated the masculinity vs. femininity of historical hurricane names on two items (1 = very masculine, 11 = very

this analysis is tricky and much debated

what would it take to try to replicate this study?

simple version: classify names and count deaths
